Australian steelwork corrosion and coatings guide

Second Edition 2015
Authors: G. Charles Clifton
Raed El Sarraf
Willie Mandeno
Peter Golding
Ann Sheehan
FOREWORD

‘The Heavy Engineering Research Association (HERA) Report R4-133 entitled ‘New Zealand Steelwork Corrosion and Coatings Guide’ was prepared by Dr G. Charles Clifton of University of Auckland and Raed El Sarraf of Opus International Consultants Ltd (both formerly of HERA). This new design guide was adapted from R4-133 for use in Australia by Willie Mandeno of Opus International Consultants Ltd and was peer-reviewed by Dr Rob Francis of RA Francis Consulting Services Pty Ltd.

The sections on hot dip galvanizing have been significantly extended and enhanced from the original HERA document by Ann Sheehan and Peter Golding of the Galvanizers Association of Australia.

Additional input from a steel industry perspective with reference to ASI fabricator members has been added by David Ryan of the Australian Steel Institute.

The Australian Steel Institute (ASI) is Australia’s peak steel industry association promoting Australian steel in manufacturing and construction, and representing the whole of the steel value chain including design and supply.

The technical support arm of the Institute organises events such as case study seminars and awards, and publishes journals (based on latest research), not to mention training both at industry and undergraduate level.

The technical references provided through the electronic online resources and library are proudly the best in the Southern Hemisphere and with longstanding links to global research and other steel industry associations such as the World Steel Association, the ASI can offer a truly international solution.

ASI would like to acknowledge the help of the following organisations, for their support and permission to use material from their publications.

- Heavy Engineering Research Association of NZ (HERA)
- Steel Construction New Zealand
- Galvanizers Association of Australia
- Australasian Corrosion Association

The ASI would like to thank Peter Golding (GAA), Rob Francis and Stephen Hicks (HERA) in particular for working together to make this document possible.

David Ryan
Editor
Australian Steel Institute

FOREWORD ................................................................................................................................. iv
LIST OF FIGURES .......................................................................................................................... viii
LIST OF TABLES ............................................................................................................................. x
INTRODUCTION AND SCOPE ......................................................................................................... xi

PART I: COATING SYSTEMS FOR CORROSION PROTECTION .......................................................... 1

1 Basics of corrosion and protective coatings .................................................................................. 1
  1.1 The corrosion process .............................................................................................................. 1
  1.2 Coating systems ....................................................................................................................... 2

2 Introduction to the Corrosion Protection Standard, AS/NZS 2312 .................................................. 6
  2.1 Introduction ............................................................................................................................ 6
  2.2 Scope of the Standard .............................................................................................................. 6
  2.3 Coating system designation to AS/NZS 2312 and relevant standards ...................................... 8

3 Steps to determine an appropriate coating system ......................................................................... 10
  3.1 Determining the Atmospheric Corrosivity Category (ACC) of a location .................................. 11
  3.2 Determining the Atmospheric Corrosivity Category for external steelwork .............................. 14
  3.3 Steelwork inside buildings .................................................................................................... 20
  3.4 Determining the expected time to first maintenance ................................................................. 25
  3.5 Use of the coatings selection tables in AS/NZS 2312 ............................................................... 29

4 Important factors for durability and coating selection ..................................................................... 37
  4.1 General factors ....................................................................................................................... 37
  4.2 Substrate and surface condition ............................................................................................. 37
  4.3 Environment (special situations) ............................................................................................. 38
  4.4 Differences with shop or site application ................................................................................ 38
  4.5 Application method ................................................................................................................ 38
  4.6 Conditions during application ............................................................................................... 39
  4.7 Surface preparation ............................................................................................................... 39
  4.8 Maintenance considerations .................................................................................................. 39
  4.9 Inspection ............................................................................................................................. 39
  4.10 Safety and environmental constraints .................................................................................... 40
  4.11 Cost ..................................................................................................................................... 40
  4.12 Abrasive environments .......................................................................................................... 40
  4.13 Steel to concrete interfaces ................................................................................................... 40
  4.14 Preventable coating defects .................................................................................................. 42
  4.15 Treatment of bolted connections ........................................................................................... 43

5 Protection of steel in non-atmospheric environments .................................................................... 45
  5.1 Guidance in AS/NZS 2312 for non-atmospheric environments ............................................... 45
  5.2 Design corrosion rates for steel piles ...................................................................................... 45

PART II: PAINT COATINGS .............................................................................................................. 47

6 Introduction to paint coatings ........................................................................................................ 47
  6.1 General – Surface preparation and coating specifications ....................................................... 47
  6.2 Specification of paint systems – Check list .............................................................................. 49

7 Composition of paint coatings ...................................................................................................... 51
  7.1 Pigments ................................................................................................................................ 51
  7.2 Binders or resins ...................................................................................................................... 51
  7.3 Solvents ................................................................................................................................ 51
7.4 Additives ........................................................................................................................................ 52
7.5 Application conditions for paint types .......................................................................................... 52
7.6 Finished appearance of coatings systems ...................................................................................... 52
7.7 Relative cost index for a range of coatings systems ........................................................................ 52

8 Description of protective paint coating systems ............................................................................... 56
8.1 General ......................................................................................................................................... 56
8.2 Paint coating systems ..................................................................................................................... 56

9 Determining the life cycle costing of a coating system (including the future maintenance cost for bridges and other steelwork) ........................................................................................................ 60
9.1 Introduction .................................................................................................................................. 60
9.2 Using the life cycle costing table .................................................................................................. 60
9.3 Life cycle costings .......................................................................................................................... 61

10 Inspection of paint coating systems before, during and after application ........................................ 63
10.1 General ....................................................................................................................................... 63
10.2 Inspection levels (surface preparation application) .................................................................... 63

11 Maintenance and recoating .............................................................................................................. 65
11.1 General ....................................................................................................................................... 65
11.2 Steel surface preparation ............................................................................................................. 66
11.3 Maintenance washing to suppress unwashed shelter effects ..................................................... 66
11.4 Repair of fire damaged coatings .................................................................................................. 66
11.5 Compatibility between different coating systems ....................................................................... 67
11.6 Non-destructive testing for coating thickness .............................................................................. 67

PART III ZINC COATINGS .................................................................................................................... 69

12 Zinc coatings – Introduction and scope ............................................................................................. 69
12.1 Other environmental factors affecting zinc-coated steelwork .................................................. 70
12.2 Types of zinc coatings ................................................................................................................ 71
12.3 After-fabrication or batch hot dip galvanizing ........................................................................... 71
12.4 Hot dip galvanizing (continuous sheet, coil, cold formed shapes) ....... ................................. 74
12.5 Thermal metal spray ................................................................................................................... 75
12.6 Mechanical plating ....................................................................................................................... 77
12.7 Electro-galvanized coatings .......................................................................................................... 77

13 Design considerations for zinc coatings .......................................................................................... 78
13.1 General considerations .................................................................................................................. 78
13.2 Design for hot dip galvanizing .................................................................................................... 81
13.3 Design for thermal spray ............................................................................................................. 86

14 Zinc coatings for internal steelwork .................................................................................................. 88

15 Protection of lintels, shelf angles and built-in steel items ................................................................. 89
15.1 Durability criteria .......................................................................................................................... 89
15.2 Specification of corrosion protection systems .............................................................................. 89
15.3 Storage, handling and transport .................................................................................................. 90
15.4 Coating systems .......................................................................................................................... 90

16 Important factors affecting coating durability .................................................................................... 91
16.1 Communication ............................................................................................................................. 91
16.2 Surface preparation and steel composition .................................................................................. 91
16.3 Reactive steels (steel composition effect on coating appearance, thickness or surface smoothness) ........................................................................................................................................ 91
16.4 Prevention of galvanic (bimetallic/dissimilar metal) corrosion .................................................... 93
16.5 Treatment of thermally cut edges ............................................................................................... 95
16.6 Shop or site application ............................................................................................................... 96
16.7 Abrasion resistance ...................................................................................................................... 96
# Inspection of zinc coatings

17.1 Zinc thermal metal spray ................................................................. 99
17.2 Continuously coated products ......................................................... 99
17.3 Hot dip galvanizing ........................................................................ 99
17.4 Non-destructive testing for coating thickness ............................... 104

# Maintenance considerations

18.1 Unwashed or sheltered areas (see also Section 3.2.3.2) .................. 106
18.2 Specific maintenance recommendations ........................................ 107
18.3 Repair of damaged galvanized steel ............................................. 107

# Life cycle costing of zinc-coated products

19.1 First cost vs. life cycle cost ........................................................... 109
19.2 The importance of durability ......................................................... 109

# Standard specification for hot dip galvanizing

20. Standard specification for hot dip galvanizing ................................. 111

# Duplex coating systems

21.1 Reasons for painting galvanized steel ............................................ 112
21.2 Surface preparation of galvanized steel prior to painting for duplex coating ..................................................... 114
21.3 Selecting the right system when painting galvanized steel .............. 115
21.4 Painting system options .............................................................. 115
21.5 Typical paints ............................................................................. 119

# Durability of zinc coatings in non-atmospheric environments

22.1 Corrosion rate in water ................................................................. 120
22.2 Corrosion rate in soil .................................................................. 121
22.3 Zinc coatings in contact with chemicals ......................................... 122
22.4 Contact with timber ................................................................... 123
22.5 The life of zinc in concrete (hot dip galvanized reinforcement) ........ 124
22.6 Protecting the steel to concrete or ground interface ....................... 124

# APPENDICES

A  Generic specifications for two coatings systems ......................... 128
B  After-fabrication hot dip galvanizing specification ....................... 138
C  Worked examples ........................................................................ 140
LIST OF FIGURES

Figure 1.1 The basic corrosion process
