

Errata to Steel Construction, volume 42, number 1 – December 2008

Please insert on page 3:

The following paper is designed to provide builders, architects and engineers with elementary details on fire protective products based on the two general paths that designers may choose to follow:

1. 'Deemed-to-Satisfy' solution; or
2. A fire engineered solution.

The fire engineered solution may offer a further 2 alternative options:

- 2a. Fire engineered solution for pricing and final design for construction; or
- 2b. Use of 'Deemed-to-Satisfy' for pricing and then a fire engineered solution for final design for construction.

The guide will examine the steps required for these options and guidance on which products may be most appropriate for certain scenarios.
