

9.2.7 Arc Seam Welds

Arc seam welds commonly find application in the narrow troughs of cold-formed steel decks and panels. The geometry of an arc seam weld is shown in Fig. 9.6(d). The observed behaviour of the arc seam welds tested at Cornell was similar to the arc spot welds although no simple shear failures were observed. The major mode of failure was tensile tearing of the sheets along the forward edge of the weld contour plus shearing of the sheets along the sides of the weld. The full set of test results for the arc welds is shown in Fig. 9.8(b). In general, there was considerably less variability than for the arc spot welds shown in Fig. 9.8(a).

Based on the Cornell tests, the following formula has been developed for arc seam welds.

$$V_n = 2.5 t f_u (0.25 l_w + 0.96 d_a) \quad (9.23)$$

where d_a is the width of the arc seam weld given by Eqs (9.18) and (9.19) with d_w equal to the visible width of the weld. The test results plotted in Fig. 9.8(b) are compared with the prediction of Eq. (9.23). The values on the abscissa of Fig. 9.8(b) are $2V_w$ since the joints tested were double lap joints. A capacity reduction factor of 0.60 is specified in Clause 5.2.5.2(b) for use with Eq. (9.23).

In addition, AS/NZS 4600 includes a formula to check the shear capacity of the weld.

$$V_n = \left[\frac{\pi d_e^2}{4} + l_w d_e \right] 0.75 f_{uw} \quad (9.24)$$

where f_{uw} is the nominal tensile strength of the weld metal. A capacity reduction factor of 0.60 is specified in Clause 5.2.5.2(a) for use with Eq. (9.24).

The minimum edge distance (e_{min}) shown in Fig 9.6(d) is the same as specified for arc spot welds and bolted connections.

9.3 Resistance Welds

Resistance welds are a type of arc spot weld and as such may fail in shear. Recommended practices for resistance welds are given in Ref. 9.5. The nominal shear capacity (V_w) of resistance spot welds are specified by Equations 5.2.7(2) and (3) of AS/NZS 4600:2005 which replaces the table in AS/NZS 4600:1996. A capacity reduction factor of 0.65 is specified in Clause 5.2.7(a) of AS/NZS 4600. By comparison, the approach developed at the Institute TNO (Ref. 9.2) uses the same design formulae for resistance welds as for arc spot welds but with a different formula for the effective weld diameter as given by Eq. (9.21) from that for arc spot welds given by Eq. (9.20).

9.4 Introduction to Bolted Connections

Bolted connections between cold-formed steel sections require different design formulae from those of hot-rolled construction as a result of the smaller ratio of sheet thickness to bolt diameter in cold-formed design. The design provisions for bolted connections in AS/NZS 4600 are based mainly on those in the AISI Specification (Ref. 1.14). The basis of the American design rules is set out in Ref. 9.6. However, some changes have been made, particularly for oversized and slotted holes, to satisfy Australian and New Zealand practice.

The Australian Standard allows use of bolts, nuts and washers to the following specifications.

AS/NZS 1110.1:2000	ISO Metric Hexagon Bolts and Screws - Product Grades A & B Part 1: Bolts (Grade 8.8 bolts up to 12 mm are available in this standard)
AS/NZS 1111.1:1996	ISO Metric Hexagon Commercial Bolts and Screws - Product Grade C Part 1: Bolts
AS/NZS 1112:1996	ISO Metric Hexagon Nuts
AS/NZS 1252:1996	High Strength Steel Bolts with Associated Nuts and Washers for Structural Engineering

Bolts manufactured according to AS/NZS 1111 are commonly of strength Grade 4.6. This designation means that their nominal tensile strength is 400 MPa and their nominal yield stress is 60 percent of this value, that is, 240 MPa. The standard size range defined in AS 1111 is from M5 to M64 where the numeral denotes their nominal diameter in millimetres.

Bolts manufactured according to AS/NZS 1252 are commonly of strength Grade 8.8. This designation means that their nominal tensile strength is 800 MPa (though 830 MPa may be used for design) and their nominal 0.2 percent proof stress is 80 percent of this value, nominally 640 MPa. The standard size range defined in AS 1252 is M16, M20, M24, M30 and M36. Grade 8.8 is also available in AS 1110 for smaller sizes.

The design rules in AS/NZS 4600 only apply when the thickness of a connected part is less than 3 mm. For connected parts 3 mm or greater, AS 4100 or NZS 3404 should be used.

A selection of bolted connections, where the bolts are principally in shear, is shown in Fig. 9.9. As shown in this figure, the bolts may be located in line with the line of action of the force (Fig. 9.9(b)) or perpendicular to the line of action of the force (Fig. 9.9(c)) or both simultaneously. The connections may be in double shear with a cover plate on each side as shown in Fig. 9.9(d) or in single shear as shown in Fig. 9.9(e). In addition, each bolt may contain washers under the head and nut, under the nut alone or under neither.

Fig. 9.9 Bolted connection geometry

The symbols, e for edge distance or distance to an adjacent bolt hole, s_f for bolt spacing perpendicular to the line of stress, and d_f for bolt diameter are shown for the various bolted connection geometries in Figs 9.9(a), 9.9(b) and 9.9(c). In Table 5.3.1, AS/NZS 4600 defines the diameter of a standard hole (d_h) as 2 mm larger than the bolt diameter (d_f) for bolt diameters 12 mm

and larger and 1 mm larger than the bolt diameter for bolts less than 12 mm diameter.

9.5 Design Formulae and Failure Modes for Bolted Connections

The four principal modes of failure for bolted connections of the types shown in Fig. 9.9 are shown in Fig. 9.10 with photos for G550 sheet steel of the first three types in Fig. 9.11. They have been classified in Ref. 9.6 as Types I, II, III and IV. This classification has been followed in this book.

Fig. 9.10 Failure modes of bolted connections

(a) End Tearout failure

(b) Bearing failure

(c) Net Section Tension failure

CONTENTS

	<i>Page</i>
PREFACE TO THE 4 th EDITION	viii
CHAPTER 1 INTRODUCTION	1
1.1 Design Standards and Specifications for Cold-Formed Steel	1
1.1.1 General	1
1.1.2 History of Australian Cold-Formed Steel Structures Standards and USA Specifications	1
1.1.3 New Developments in the 2005 Edition	2
1.2 Common Section Profiles and Applications of Cold-Formed Steel	4
1.3 Manufacturing Processes	10
1.4 Special Problems in the Design of Cold-Formed Sections	12
1.4.1 Local Buckling and Post-local Buckling of Thin Plate Elements	12
1.4.2 Propensity for Twisting	13
1.4.3 Distortional Buckling	14
1.4.4 Cold Work of Forming	14
1.4.5 Web Crippling under Bearing	15
1.4.6 Connections	15
1.4.7 Corrosion Protection	16
1.4.8 Inelastic Reserve Capacity	16
1.4.9 Fatigue	16
1.5 Loading Combinations	17
1.6 Limit States Design	17
1.7 Computer Analysis	19
1.8 References	20
CHAPTER 2 MATERIALS AND COLD WORK OF FORMING	22
2.1 Steel Standards	22
2.2 Typical Stress-Strain Curves	23
2.3 Ductility	25
2.4 Effects of Cold Work on Structural Steels	29
2.5 Corner Properties of Cold-Formed Sections	30
2.6 Fracture Toughness	32
2.6.1 Background	32
2.6.2 Measurement of Critical Stress Intensity Factors	32
2.6.3 Evaluation of the Critical Stress Intensity Factors for Perforated Coupon Specimens	34
2.6.4 Evaluation of the Critical Stress Intensity Factors for Triple Bolted Specimens	35
2.7 References	36
CHAPTER 3 BUCKLING MODES OF THIN-WALLED MEMBERS IN COMPRESSION AND BENDING	37
3.1 Introduction to the Finite Strip Method	37
3.2 Monosymmetric Column Study	38
3.2.1 Unlipped Channel	38
3.2.2 Lipped Channel	41
3.2.3 Lipped Channel (Fixed Ended)	44
3.3 Purlin Section Study	45
3.3.1 Channel Section	45
3.3.2 Z-Section	46

3.4	Tubular Flange Sections	47
3.4.1	Hollow Flange Beam in Bending	47
3.4.2	LiteSteel Beam Section in Bending	48
3.5	References	49
CHAPTER 4 STIFFENED AND UNSTIFFENED COMPRESSION ELEMENTS		50
4.1	Local Buckling	50
4.2	Postbuckling of Plate Elements in Compression	51
4.3	Effective Width Formulae for Imperfect Elements in Pure Compression	52
4.4	Effective Width Formulae for Imperfect Elements under Stress Gradient	56
4.4.1	Stiffened Elements	56
4.4.2	Unstiffened Elements	56
4.5	Effective Width Formulae for Elements with Stiffeners	57
4.5.1	Edge Stiffened Elements	57
4.5.2	Intermediate Stiffened Elements with One Intermediate Stiffener	58
4.5.3	Edge Stiffened Elements with Intermediate Stiffeners, and Stiffened Elements with more than One Intermediate Stiffener	58
4.5.4	Uniformly Compressed Edge Stiffened Elements with Intermediate Stiffeners	59
4.6	Examples	59
4.6.1	Hat Section in Bending	59
4.6.2	Hat Section in Bending with Intermediate Stiffener in Compression Flange	63
4.6.3	C-Section Purlin in Bending	68
4.7	References	75
CHAPTER 5 BEAMS, PURLINS AND BRACING		76
5.1	General	76
5.2	Flexural-Torsional (Lateral) Buckling	77
5.2.1	Elastic Buckling of Unbraced Simply Supported Beams	77
5.2.2	Continuous Beams and Braced Simply Supported Beams	81
5.2.3	Bending Strength Design Equations	85
5.3	Distortional Buckling	86
5.3.1	Flange Distortional Buckling	86
5.3.2	Lateral-Distortional Buckling	89
5.4	Basic Behaviour of Purlins	89
5.4.1	Linear Response of Channel and Z-sections	89
5.4.2	Stability Considerations	92
5.4.3	Sheeting and Connection Types	94
5.5	Design Methods for Purlins	95
5.5.1	No Lateral and Torsional Restraint Provided by the Sheeting	95
5.5.2	Lateral Restraint but No Torsional Restraint	95
5.5.3	Lateral and Torsional Restraint	96
5.6	Bracing	98
5.7	Inelastic Reserve Capacity	101
5.7.1	Sections with Flat Elements	101
5.7.2	Cylindrical Tubular Members	102
5.8	Examples	102
5.8.1	Simply Supported C-Section Purlin	102
5.8.2	Distortional Buckling Stress for C-Section	107
5.8.3	Continuous Lapped Z-Section Purlin	108
5.8.4	Z-Section Purlin in Bending	116
5.9	References	122

CHAPTER 6	WEBS	125
6.1	General	125
6.2	Webs in Shear	125
6.2.1	Shear Buckling	125
6.2.2	Shear Yielding	127
6.3	Webs in Bending	127
6.4	Webs in Combined Bending and Shear	129
6.5	Web Stiffeners	130
6.6	Web Crippling (Bearing) of Open Sections	130
6.6.1	Edge Loading Alone	130
6.6.2	Combined Bending and Edge Loading	133
6.7	Webs with Holes	134
6.8	Examples	136
6.8.1	Combined Bending and Shear at the End of the Lap of a Continuous Z-Section Purlin	136
6.8.2	Combined Bearing and Bending of Hat Section	138
6.9	References	139
CHAPTER 7	COMPRESSION MEMBERS	141
7.1	General	141
7.2	Elastic Member Buckling	141
7.2.1	Flexural, Torsional and Flexural-Torsional Buckling	141
7.2.2	Distortional Buckling	143
7.3	Section Capacity in Compression	143
7.4	Member Capacity in Compression	144
7.4.1	Flexural, Torsional and Flexural-Torsional Buckling	144
7.4.2	Distortional Buckling	146
7.5	Effect of Local Buckling	147
7.5.1	Monosymmetric Sections	147
7.5.2	High Strength Steel Box Sections	149
7.6	Examples	151
7.6.1	Square Hollow Section Column	151
7.6.2	Unlipped Channel Column	153
7.6.3	Lipped Channel Column	157
7.7	References	164
CHAPTER 8	MEMBERS IN COMBINED AXIAL LOAD AND BENDING	165
8.1	Combined Axial Compressive Load and Bending - General	165
8.2	Interaction Equations for Combined Axial Compressive Load and Bending	166
8.3	Monosymmetric Sections under Combined Axial Compressive Load and Bending	167
8.3.1	Sections Bent in a Plane of Symmetry	167
8.3.2	Sections Bent about an Axis of Symmetry	169
8.4	Combined Axial Tensile Load and Bending	170
8.5	Examples	171
8.5.1	Unlipped Channel Section Beam-Column Bent in Plane of Symmetry	171
8.5.2	Unlipped Channel Section Beam-Column Bent about Plane of Symmetry	174
8.5.3	Lipped Channel Section Beam-Column Bent in Plane of Symmetry	176
8.6	References	180

CHAPTER 9	CONNECTIONS	182
9.1	Introduction to Welded Connections	182
9.2	Fusion Welds	184
9.2.1	Butt Welds	184
9.2.2	Fillet Welds subject to Transverse Loading	184
9.2.3	Fillet Welds subject to Longitudinal Loading	185
9.2.4	Combined Longitudinal and Transverse Fillet Welds	186
9.2.5	Flare Welds	186
9.2.6	Arc Spot Welds (Puddle Welds)	187
9.2.7	Arc Seam Welds	190
9.3	Resistance Welds	190
9.4	Introduction to Bolted Connections	190
9.5	Design Formulae and Failure Modes for Bolted Connections	192
9.5.1	Tearout Failure of Sheet (Type I)	193
9.5.2	Bearing Failure of Sheet (Type II)	193
9.5.3	Net Section Tension Failure (Type III)	194
9.5.4	Shear Failure of Bolt (Type IV)	196
9.6	Screw Fasteners and Blind Rivets	196
9.7	Rupture	200
9.8	Examples	201
9.8.1	Welded Connection Design Example	201
9.8.2	Bolted Connection Design Example	205
9.9	References	208
CHAPTER 10	DIRECT STRENGTH METHOD	209
10.1	Introduction	209
10.2	Elastic Buckling Solutions	209
10.3	Strength Design Curves	210
10.3.1	Local Buckling	210
10.3.2	Flange-distortional buckling	212
10.3.3	Overall buckling	213
10.4	Direct Strength Equations	213
10.5	Examples	215
10.5.1	Lipped Channel Column (Direct Strength Method)	215
10.5.2	Simply Supported C-Section Beam	216
10.6	References	218
CHAPTER 11	STEEL STORAGE RACKING	219
11.1	Introduction	219
11.2	Loads	220
11.3	Methods of Structural Analysis	221
11.3.1	Upright Frames - First Order	222
11.3.2	Upright Frames - Second Order	223
11.3.3	Beams	223
11.4	Effects of Perforations (Slots)	224
11.4.1	Section Modulus of Net Section	224
11.4.2	Minimum Net Cross-Sectional Area	225
11.4.3	Form Factor (Q)	225
11.5	Member Design Rules	225
11.5.1	Flexural Design Curves	225
11.5.2	Column Design Curves	226

11.5.3 Distortional Buckling	227
11.6 Example	227
11.7 References	235
SUBJECT INDEX BY SECTION	236
