

$$M_c = 1.11M_y \left( 1 - \frac{10M_y}{36M_o} \right) \quad \text{for } 2.78 M_y > M_o > 0.56 M_y \quad (5.23)$$

$$M_c = M_o \quad \text{for } M_o \leq 0.56 M_y \quad (5.24)$$

They are included for all cases in AS/NZS 4600:2005 as Eqs (3.3.3.2(3))-(5). They have been confirmed by research on purlins in Ref. 5.7 and on beam-columns in Refs 5.8 and 5.9. They are compared with the former equations in AS/NZS 4600:1996 Clause 3.3.3.2(b) in Fig. 5.8. It can be seen that the 2005 equations are significantly above the 1996 equations for beam non-dimensional slenderness values greater than approximately 1.0. The Eurocode 3 Part 1.3 (Ref. 1.20) beam design curve is also shown in Fig. 5.8 for comparison.

**Fig. 5.8 Comparison of beam design curves**

A detailed discussion of the lateral buckling strengths of unsheeted cold-formed beams is given in Ref. 5.10.

### 5.3 Distortional Buckling

#### 5.3.1 Flange Distortional Buckling

##### 5.3.1.1 Compression Members

Distortional buckling of compression members such as C-sections usually involves rotation of each flange and lip about the flange-web junction in opposite directions as shown in Fig. 1.18(a). This mode is often called 'flange distortional buckling'. The web undergoes flexure at the same half-wavelength as the flange buckle, and the whole section may translate slightly in a direction normal to the web also at the same half-wavelength as the flange and web buckling deformation. Distortional buckling in this mode has been investigated in detail by Hancock (Ref. 5.11) mainly for sections used in steel storage racks, by Lau and Hancock (Refs 5.12, 5.13, 5.14) for a range of different C- and rack sections, and by Kwon and Hancock (Refs 5.15, 5.16) for high strength steel channel sections with intermediate stiffeners.

The elastic distortional buckling stress ( $f_{od}$ ) is based on the flexural-torsional buckling of a simple flange model developed by Lau and Hancock (Ref. 5.17) as shown in Fig. 5.9(a). The rotational spring ( $k_\phi$ ) represents the flexural restraint provided by the web which is in pure compression, and the translational spring ( $k_x$ ) represents the resistance to translational

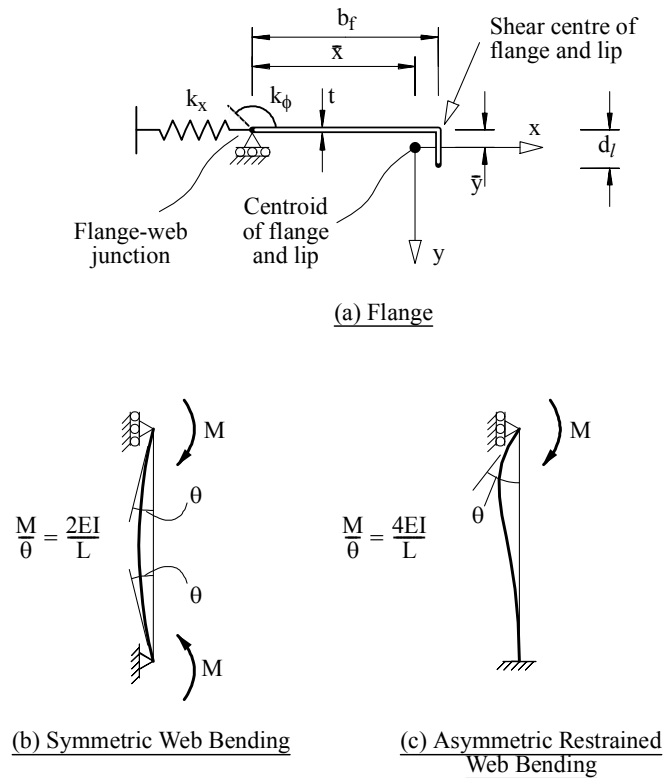

movement of the section in the buckling mode. As a result of the compressive stress in the web, the model includes a reduction in the flexural restraint provided by the web. The model as derived is not limited to simple flange-lip combinations but may involve complex lips with sloping stiffeners and/or return lips. In the Lau and Hancock model, it is assumed that the value of the translational spring stiffness ( $k_x$ ) is zero so that the flange was free to translate in the x-direction in the buckling mode. The equation for the rotational spring stiffness ( $k_\phi$ ) is given by

$$k_\phi = \frac{Et^3}{5.46(b_w + 0.06\lambda)} \left[ 1 - \frac{1.11f'_{od}}{Et^2} \left( \frac{b_w^2\lambda}{b_w^2 + \lambda^2} \right)^2 \right] \quad (5.25)$$

where  $b_w$  is the web depth. In Eq. (5.25),  $\lambda$  is the half-wavelength of the distortional buckle given by:

$$\lambda = 4.80 \left( \frac{I_{xf} b_f^2 b_w}{t^3} \right)^{0.25} \quad (5.26)$$

where  $I_{xf}$  is the second moment of area of the flange and lip about the x-axis in Fig. 5.9(a). The spring restraint ( $k_\phi$ ) assumes the web is bent symmetrically as shown in Fig. 5.9(b). The term ( $f'_{od}$ ) is the compressive stress in the web at distortional buckling, computed assuming  $k_\phi$  is zero. The computation process is iterative due to the incorporation of  $f'_{od}$  in Eq. (5.25), but only one iteration is required. These formulations are included in Appendices D1 and D2 of AS/NZS 4600.

**Fig. 5.9 Flange distortional buckling model**

Strength design curves were derived from test data in Kwon and Hancock (Ref. 5.16) and summarised in Hancock et al. (Ref. 5.18). They are described in detail in Chapter 7 of this book.

### 5.3.1.2 Flexural Members

Flange distortional buckling of flexural members such as C- and Z-sections usually involves rotation of only the compression flange and lip about the flange-web junction as shown in Fig. 1.18(b). The web undergoes flexure at the same half-wavelength as the flange buckle, and the compression flange may translate slightly in a direction normal to the web, also at the same half-wavelength as the flange and web buckling deformations. The web buckle involves double curvature transverse bending of the web as described in Hancock (Ref 5.19). A graph of buckling stress versus buckle half-wavelength is shown in Fig. 3.12. In this figure, it can be seen that the buckling stress for the short half-wavelength flange distortional buckling is significantly less than that for the longer half-wavelength lateral distortional buckling with transverse web bending when the tension flange of the C-section is restrained to prevent flexural-torsional buckling.

As for the compression member, the elastic distortional buckling stress ( $f_{od}$ ) for flange distortional buckling is based on the flexural-torsional buckling of a simple flange model as shown in Fig. 5.9(a). The rotational spring ( $k_\phi$ ) represents the flexural restraint provided by the web which is in bending, and the translational spring ( $k_x$ ) represents the resistance to translational movement of the section in the buckling mode. As a result of the compressive stress in the web resulting from bending, the model includes a reduction in the flexural restraint provided by the web. This reduction is different from that for the compression member given by Eq. (5.25). The equation for the rotational spring stiffness ( $k_\phi$ ) is given by:

$$k_\phi = \left[ \frac{2Et^3}{5.46(b_w + 0.06\lambda)} \right] \times \left[ 1 - \frac{1.11f'_{od}}{Et^2} \left( \frac{b_w^4 \lambda^2}{12.56\lambda^4 + 2.192b_w^4 + 13.39\lambda^2 b_w^2} \right) \right] \quad (5.27)$$

where the symbols are the same as for Eq. (5.25). In Eq. (5.27),  $\lambda$  is the half-wavelength of the distortional buckle given by:

$$\lambda = 4.80 \left( \frac{I_{xf} b_f^2 b_w}{2t^3} \right)^{0.25} \quad (5.28)$$

where  $I_{xf}$  is the second moment of area of the flange and lip about the x-axis in Fig. 5.9(a).

The spring restraint ( $k_\phi$ ) assumes the web is bent asymmetrically as shown in Fig. 5.9(c).

As for compression, the term  $f'_{od}$  is the compressive stress in the web at distortional buckling, computed assuming  $k_\phi$  is zero. The computation process is iterative due to the incorporation of  $f'_{od}$  in Eq. (5.27) but only one iteration is required. These formulations have been included in Appendix D3 of AS/NZS 4600.

Strength design curves were calibrated against test data in Hancock, Rogers and Schuster (Ref. 5.20). They have been included as Clause 3.3.3.3(a) of AS/NZS 4600. They are not the same as for compression members since it appears that the strength in bending is slightly higher than in compression.

PREFACE TO THE 4 <sup>th</sup> EDITION	viii
CHAPTER 1 INTRODUCTION	1
1.1 Design Standards and Specifications for Cold-Formed Steel	1
1.1.1 General	1
1.1.2 History of Australian Cold-Formed Steel Structures Standards and USA Specifications	1
1.1.3 New Developments in the 2005 Edition	2
1.2 Common Section Profiles and Applications of Cold-Formed Steel	4
1.3 Manufacturing Processes	10
1.4 Special Problems in the Design of Cold-Formed Sections	12
1.4.1 Local Buckling and Post-local Buckling of Thin Plate Elements	12
1.4.2 Propensity for Twisting	13
1.4.3 Distortional Buckling	14
1.4.4 Cold Work of Forming	14
1.4.5 Web Crippling under Bearing	15
1.4.6 Connections	15
1.4.7 Corrosion Protection	16
1.4.8 Inelastic Reserve Capacity	16
1.4.9 Fatigue	16
1.5 Loading Combinations	17
1.6 Limit States Design	17
1.7 Computer Analysis	19
1.8 References	20
CHAPTER 2 MATERIALS AND COLD WORK OF FORMING	22
2.1 Steel Standards	22
2.2 Typical Stress-Strain Curves	23
2.3 Ductility	25
2.4 Effects of Cold Work on Structural Steels	29
2.5 Corner Properties of Cold-Formed Sections	30
2.6 Fracture Toughness	32
2.6.1 Background	32
2.6.2 Measurement of Critical Stress Intensity Factors	32
2.6.3 Evaluation of the Critical Stress Intensity Factors for Perforated Coupon Specimens	34
2.6.4 Evaluation of the Critical Stress Intensity Factors for Triple Bolted Specimens	35
2.7 References	36
CHAPTER 3 BUCKLING MODES OF THIN-WALLED MEMBERS IN COMPRESSION AND BENDING	37
3.1 Introduction to the Finite Strip Method	37
3.2 Monosymmetric Column Study	38
3.2.1 Unlipped Channel	38
3.2.2 Lipped Channel	41
3.2.3 Lipped Channel (Fixed Ended)	44
3.3 Purlin Section Study	45
3.3.1 Channel Section	45
3.3.2 Z-Section	46

3.4	Tubular Flange Sections	47
3.4.1	Hollow Flange Beam in Bending	47
3.4.2	LiteSteel Beam Section in Bending	48
3.5	References	49
CHAPTER 4 STIFFENED AND UNSTIFFENED COMPRESSION ELEMENTS		50
4.1	Local Buckling	50
4.2	Postbuckling of Plate Elements in Compression	51
4.3	Effective Width Formulae for Imperfect Elements in Pure Compression	52
4.4	Effective Width Formulae for Imperfect Elements under Stress Gradient	56
4.4.1	Stiffened Elements	56
4.4.2	Unstiffened Elements	56
4.5	Effective Width Formulae for Elements with Stiffeners	57
4.5.1	Edge Stiffened Elements	57
4.5.2	Intermediate Stiffened Elements with One Intermediate Stiffener	58
4.5.3	Edge Stiffened Elements with Intermediate Stiffeners, and Stiffened Elements with more than One Intermediate Stiffener	58
4.5.4	Uniformly Compressed Edge Stiffened Elements with Intermediate Stiffeners	59
4.6	Examples	59
4.6.1	Hat Section in Bending	59
4.6.2	Hat Section in Bending with Intermediate Stiffener in Compression Flange	63
4.6.3	C-Section Purlin in Bending	68
4.7	References	75
CHAPTER 5 BEAMS, PURLINS AND BRACING		76
5.1	General	76
5.2	Flexural-Torsional (Lateral) Buckling	77
5.2.1	Elastic Buckling of Unbraced Simply Supported Beams	77
5.2.2	Continuous Beams and Braced Simply Supported Beams	81
5.2.3	Bending Strength Design Equations	85
5.3	Distortional Buckling	86
5.3.1	Flange Distortional Buckling	86
5.3.2	Lateral-Distortional Buckling	89
5.4	Basic Behaviour of Purlins	89
5.4.1	Linear Response of Channel and Z-sections	89
5.4.2	Stability Considerations	92
5.4.3	Sheeting and Connection Types	94
5.5	Design Methods for Purlins	95
5.5.1	No Lateral and Torsional Restraint Provided by the Sheeting	95
5.5.2	Lateral Restraint but No Torsional Restraint	95
5.5.3	Lateral and Torsional Restraint	96
5.6	Bracing	98
5.7	Inelastic Reserve Capacity	101
5.7.1	Sections with Flat Elements	101
5.7.2	Cylindrical Tubular Members	102
5.8	Examples	102
5.8.1	Simply Supported C-Section Purlin	102
5.8.2	Distortional Buckling Stress for C-Section	107
5.8.3	Continuous Lapped Z-Section Purlin	108
5.8.4	Z-Section Purlin in Bending	116
5.9	References	122

CHAPTER 6	WEBS	125
6.1	General	125
6.2	Webs in Shear	125
6.2.1	Shear Buckling	125
6.2.2	Shear Yielding	127
6.3	Webs in Bending	127
6.4	Webs in Combined Bending and Shear	129
6.5	Web Stiffeners	130
6.6	Web Crippling (Bearing) of Open Sections	130
6.6.1	Edge Loading Alone	130
6.6.2	Combined Bending and Edge Loading	133
6.7	Webs with Holes	134
6.8	Examples	136
6.8.1	Combined Bending and Shear at the End of the Lap of a Continuous Z-Section Purlin	136
6.8.2	Combined Bearing and Bending of Hat Section	138
6.9	References	139
CHAPTER 7	COMPRESSION MEMBERS	141
7.1	General	141
7.2	Elastic Member Buckling	141
7.2.1	Flexural, Torsional and Flexural-Torsional Buckling	141
7.2.2	Distortional Buckling	143
7.3	Section Capacity in Compression	143
7.4	Member Capacity in Compression	144
7.4.1	Flexural, Torsional and Flexural-Torsional Buckling	144
7.4.2	Distortional Buckling	146
7.5	Effect of Local Buckling	147
7.5.1	Monosymmetric Sections	147
7.5.2	High Strength Steel Box Sections	149
7.6	Examples	151
7.6.1	Square Hollow Section Column	151
7.6.2	Unlipped Channel Column	153
7.6.3	Lipped Channel Column	157
7.7	References	164
CHAPTER 8	MEMBERS IN COMBINED AXIAL LOAD AND BENDING	165
8.1	Combined Axial Compressive Load and Bending - General	165
8.2	Interaction Equations for Combined Axial Compressive Load and Bending	166
8.3	Monosymmetric Sections under Combined Axial Compressive Load and Bending	167
8.3.1	Sections Bent in a Plane of Symmetry	167
8.3.2	Sections Bent about an Axis of Symmetry	169
8.4	Combined Axial Tensile Load and Bending	170
8.5	Examples	171
8.5.1	Unlipped Channel Section Beam-Column Bent in Plane of Symmetry	171
8.5.2	Unlipped Channel Section Beam-Column Bent about Plane of Symmetry	174
8.5.3	Lipped Channel Section Beam-Column Bent in Plane of Symmetry	176
8.6	References	180

CHAPTER 9	CONNECTIONS	182
9.1	Introduction to Welded Connections	182
9.2	Fusion Welds	184
9.2.1	Butt Welds	184
9.2.2	Fillet Welds subject to Transverse Loading	184
9.2.3	Fillet Welds subject to Longitudinal Loading	185
9.2.4	Combined Longitudinal and Transverse Fillet Welds	186
9.2.5	Flare Welds	186
9.2.6	Arc Spot Welds (Puddle Welds)	187
9.2.7	Arc Seam Welds	190
9.3	Resistance Welds	190
9.4	Introduction to Bolted Connections	190
9.5	Design Formulae and Failure Modes for Bolted Connections	192
9.5.1	Tearout Failure of Sheet (Type I)	193
9.5.2	Bearing Failure of Sheet (Type II)	193
9.5.3	Net Section Tension Failure (Type III)	194
9.5.4	Shear Failure of Bolt (Type IV)	196
9.6	Screw Fasteners and Blind Rivets	196
9.7	Rupture	200
9.8	Examples	201
9.8.1	Welded Connection Design Example	201
9.8.2	Bolted Connection Design Example	205
9.9	References	208
CHAPTER 10	DIRECT STRENGTH METHOD	209
10.1	Introduction	209
10.2	Elastic Buckling Solutions	209
10.3	Strength Design Curves	210
10.3.1	Local Buckling	210
10.3.2	Flange-distortional buckling	212
10.3.3	Overall buckling	213
10.4	Direct Strength Equations	213
10.5	Examples	215
10.5.1	Lipped Channel Column (Direct Strength Method)	215
10.5.2	Simply Supported C-Section Beam	216
10.6	References	218
CHAPTER 11	STEEL STORAGE RACKING	219
11.1	Introduction	219
11.2	Loads	220
11.3	Methods of Structural Analysis	221
11.3.1	Upright Frames - First Order	222
11.3.2	Upright Frames - Second Order	223
11.3.3	Beams	223
11.4	Effects of Perforations (Slots)	224
11.4.1	Section Modulus of Net Section	224
11.4.2	Minimum Net Cross-Sectional Area	225
11.4.3	Form Factor (Q)	225
11.5	Member Design Rules	225
11.5.1	Flexural Design Curves	225
11.5.2	Column Design Curves	226

11.5.3 Distortional Buckling	227
11.6 Example	227
11.7 References	235
SUBJECT INDEX BY SECTION	236
